

CONSULTING SHEET

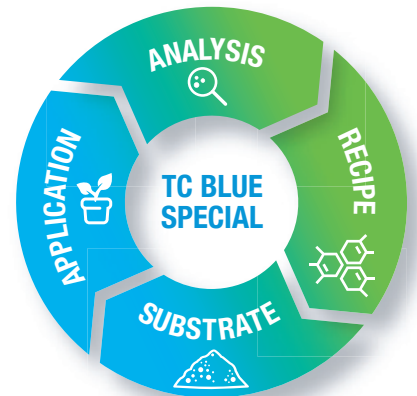

About 80% of our crop plants can be cultivated in our TC pre-cultivation substrates, as many plant groups have similar cultivation requirements, either in propagation or in the further cultivation period.

But there are many reasons to choose an individual recipe:

- special substrate with customized fertilizer combinations or additives
- special mixture with customized composition
- addition of depot fertilizer shortly before start of cultivation
- individual composition of the raw material components

On the other hand, country-specific conditions, cultivation methods, plant equipment or technical features may require a special mixture.

THE WAY TO SPECIAL SUBSTRATES

QUESTIONNAIRE FOR YOUR SPECIAL SUBSTRATE

To which horticultural division does your company belong?

- vegetable growing ornamental plant growing tree nursery soft fruit forestry mushroom cultivation
- other

Which cultures?

Cultivation methods? Plant or pot size?

- conventional cultivation organic cultivation

Type of irrigation and fertilization

- ebb and flow overhead irrigation drip irrigation handcraft other

Cultural area

- glass greenhouse foil greenhouse foil tunnel field

Fertilizer technology

Which fertilization technology do you work with?

Technical equipment

- potting machine with dosing hopper mixing device for mixing in further raw materials or additives filling the pots by hand
